

The GSM tracker

50 grams of worldwide traceability.

This small and light tracker can simply fit everywhere, enabling you to locate and trace objects in practically any country of the world.

Its extremely low power consumption lets you operate for months. And when battery is empty, it is rechargeable with a standard mini-USB cable. The GSM tracker therefore reduces handling costs to the minimum.

We did our best to give this tracker a nice and functional design. But of course, if white isn't your favorite color, it can be customized with your own logo and branding.

The GSM tracker has been optimized to work at best with the Kizy online tracking platform, the coordination center for all your tracking activities. In addition, a fully fledged API is available for direct integration.

Real Tracking

Very low power consumption
Its rechargeable battery makes the GSM tracker independent from all external energy sources. Its very low power consumption lets it operate for up to 1 year.

Easy handling
The only interface with the user is the on/off switch and 3 LEDs on the front which display the tracker's status in an intuitive manner. Use the integrated fixing eyelet to attach the tracker to any object with an ordinary strap.

Fits everywhere
Thanks to its compact dimensions and weight under 50 grams, the GSM tracker can accompany a wide range of objects: from a container or a pallet down to a standard envelope.

Branding & customization
If our standard white isn't your favorite color, you can customize the design of the tracker to suit your needs and enhance your brand.

Global coverage
Its integrated SIM card allows your tracker to operate worldwide. Thanks to roaming agreements with major telecom operators, we cover over 95% of the world.

USB interface
Docking stations and proprietary connectivity interfaces are now a thing of the past. The GSM tracker is rechargeable with a standard mini-USB cable. Even though you probably already have a standard cable at your office, every pack of trackers comes with a mini-USB cable included.

Technical data sheet

Communication technology	GSM-2G
Communication protocol	proprietary
SIM card	embedded
I/O interface	on-off switch 3 LEDs (red, yellow, green) mini-USB
Expansion slot	I2C
Battery type	Li-ion tracking operation continues during charging
Accuracy	from about 200m up to 2 km depending on the GSM network density
Typical battery life	From 6 months to 1 year
Casing	Non-flammable White
Size (l x w x h)	100mm x 48mm x 9.8mm
Weight	< 47.5g
IP class	IP54
Certifications	CE & FCC
Sensors	Light
